Key words: Hymenoptera, Formicidae, *Emplastus*, new name, Russian Far East, Late Eocene, Radoboj, Miocene.

Ключевые слова: Hymenoptera, Formicidae, *Emplastus*, новое название, Приморский край, эоцен, Радобой, миоцен.

Abstract. *Emplastus biamensis* nom. n. is proposed as replacement name for the female ant *Emplastus dubius* Dlussky, Rasnitsyn et Perfilieva, 2015 from Late Eocene of Sikhote-Alin, Russian Far East, because of homonymy with *E. dubius* Dlussky et Putyatina, 2014. Comparison of the renamed species with congeners is updated.

Резюме. Новое название *Emplastus biamensis* nom. n. взамен преоккупированного предложено для муравья *Emplastus dubius* Dlussky, Rasnitsyn et Perfilieva, 2015 (non *E. dubius* Dlussky et Putyatina, 2014) из позднеэоценовых отложений Приморского края. Дополнено сравнение этого вида с аругими видами *Emplastus*.

The name *Emplastus dubius* has been almost simultaneously proposed for two different ant fossils from different deposits, the Miocene of Radoboj, Croatia [Dlussky, Putyatina, 2014] and Eocene of Bol'shaya Svetlovodnaya, Russian Far East [Dlussky et al., 2015]. Hence the name *Emplastus dubius* Dlussky, Rasnitsyn et Perfilieva, 2015 is a junior homonym and so deserves replacement which is provided below. The two species affected with homonymy have not been originally compared: this omission is corrected here as well.

Taxonomy

Emplastus biamensis Perfilieva et Rasnitsyn, nom. n.

Emplastus dubius Dlussky, Rasnitsyn et Perfilieva, 2015: 135 (non *Emplastus dubius*: Dlussky, Putyatina, 2014: 242); Bol'shaya Svetlovodnaya, Late Eocene of Sikhote-Alin, Russia.

Remarks. Unfortunately the species of *Emplastus* considered in the two publications in question have left not compared each other, which may cause problems in their identification. To smooth the problem, we provide the comparison. *Emplastus britannicus* Cockerell, 1915, *E. gurnetensis* Donisthorpe, 1920, *E. dubius* Dlussky et Putyatina, 2014, *E. haueri* Dlussky et Putyatina, 2014, *E. miocenicus* Dlussky et Putyatina, 2014 and *E. (?) ocellus* Dlussky et Putyatina, 2014 are all described after the female sex [Cockerell, 1915; Donisthorpe, 1920; Dlussky, Putyatina, 2014]. *Emplastus britannicus* and *E. gurnetensis* differ from *E. biamensis* nom. n. in having petiolar scale thicker and higher. Scutum is about 1.5 times as long as scutellum in *E. dubius* and only 1.1 times as long as scutellum in *E. biamensis*. Ratio of mesosoma length to gaster length is considerably higher in *E. haueri* comparing *E. biamensis* (0.7 and 0.5, respectively). Occipital margin is concave in *E. (?) ocellus* and convex in *E. biamensis*. Gynes are bigger in *E. britannicus*, *E. dubius* and *E. miocenicus* than in *E. biamensis* (body length 6–8.5, 7.5, 13.5 and 5 mm, respectively).

Etymology. After the former name of the type locality (Biam).

Acknowledgements

We thank Dr. Matthew E. Clapham (University of California, Santa Cruz, USA) who kindly brought this problem to our attention.

The study was supported by the Russian Foundation for Basic Research, project No. 14-04-00658.
